

General wellness & longevity

NOVA-V1 IV push series in a 250 mL saline drip · physician reference protocol

CARRIER

250 mL

0.9% saline, on drip

NOVA-V1

2-4 cc

slow IV push into the line

PUSH SPACING

≥ 1 min

between each IV push

OBSERVATION

15-30 min

post-infusion

A systemic wellness and longevity approach: NOVA-V1 given as a slow IV push into a running 250 mL saline drip, followed by a spaced sequence of supportive micronutrients — with at least one minute between each push to monitor tolerance.

Indications

- General wellness and vitality optimization
- Healthy-aging and longevity support
- Antioxidant and mitochondrial support
- Energy, recovery, and immune support
- Adjunct to a physician-directed wellness program

Contraindications & cautions

- Active infection or sepsis
- Known hypersensitivity to any component (cobalamin, thiamine, NAC, zinc)
- Uncontrolled coagulopathy
- Fluid-overload states (decompensated CHF, significant renal impairment) — caution with the 250 mL bolus
- Pregnancy or breastfeeding unless cleared by the treating physician

Procedure

PREPARATION

1. Review history, medications, and allergies; obtain informed consent.
2. Establish patent IV access (20–22 G).
3. Hang 250 mL 0.9% saline; start a slow-to-moderate drip and confirm patency, no infiltration.
4. Verify each additive, dose, and product integrity before use.
5. Have anaphylaxis / emergency supplies on hand.

POST — PATIENT INSTRUCTIONS

- Hydrate well over the next 24 h
- Report any delayed rash, wheezing, or swelling
- Resume normal activity as tolerated
- Space treatments per the physician plan

IV PUSH SEQUENCE — ≥ 1 MIN BETWEEN EACH

1. **NOVA-V1 2-4 cc** — slow IV push into the running line.
2. **Vitamin B-12** (methylcobalamin) — 500 mcg.
3. **Thiamine (B1)** — 100 mg.
4. **NAC** (N-acetylcysteine) — 600 mg.
5. **Zinc** — 4 mg.

Push each slowly and pause **≥ 1 minute** between pushes, watching for flushing, chest tightness, taste change, or hypotension. Then let the remaining saline infuse to completion.

FOLLOW-UP & OUTCOME MEASURES

Reassess energy, recovery, and wellness goals at **2-4 weeks**. Repeat on a physician-directed cadence (e.g., **every 2-4 weeks**) based on response and tolerance.

WHAT WE DID TODAY

You received an IV wellness infusion: a 250 mL saline drip with NOVA-V1 and a spaced series of supportive nutrients (Vitamin B-12, Thiamine, NAC, and Zinc), each given slowly with a short pause in between.

WHAT TO EXPECT

- Possible warmth, a vitamin taste, or mild flushing during the pushes
- A short period of feeling tired or energized afterward
- Mild soreness at the IV site for a day

AFTERCARE**DO**

- Hydrate well over the next 24 hours
- Eat a normal meal
- Resume activity as tolerated
- Keep any planned follow-up

AVOID

- Skipping fluids afterward
- Alcohol for 24 h
- Ignoring a delayed rash or swelling
- Strenuous exercise right after if lightheaded

WHEN TO CALL US

Call the clinic — or seek urgent care — for: spreading rash or hives, wheezing or trouble breathing, facial or throat swelling, fever, or severe or worsening pain at an injection or IV site.
