

Reading a certificate of analysis

What each field means, and what should stop you from dosing

FIELD	WHAT IT TELLS YOU	CHECK
Product & lot number	Identifies the exact manufacturing run in your hand	Matches the vial label, exactly
Expiration date	Last date the lot may be administered	Falls after today's date
Sterility	Culture result for the final container, USP <71>	No growth
Endotoxin	Pyrogen burden by LAL assay, USP <85>	Within the stated limit
Mycoplasma	Screen for contamination invisible to standard culture	Negative
Cell or particle count	Dose basis — cells per vial, or vesicle particles per mL	Consistent with the protocol dose
Identity markers	Flow phenotype confirming what the product is	Matches the product monograph
Donor eligibility	Screening and infectious-disease testing per 21 CFR 1271	Eligible, statement present

Do not administer if

- The lot number on the COA does not match the vial
- Any release test is missing, pending, or marked out of specification
- The expiry has passed or the date is ambiguous
- The COA is unsigned or the document is illegible
- The lot passed through an undocumented temperature excursion
- The cell or particle count is inconsistent with the dose you planned
- The donor eligibility statement is absent

Filing

- Keep the original COA with the chain-of-custody log for that lot
- Place a copy or the lot number in each recipient's chart
- Retain the vial label or a photograph of it where policy requires
- Request a replacement COA from CelluNOVA before use if one is missing

QUESTIONS ON A LOT

CelluNOVA · 801.787.2123 · cellunova.bio — have the product name and lot number ready.
